Creating User-Mode Device Drivers with a Proxy

The creation of device drivers is one of the most difficult challenges facing Windows NT developers. Device drivers are generally written with development environments and debuggers that differ from those used to create other NT programs. Perhaps most challenging to many developers, NT device drivers must be fully re-entrant and must not block.

Implementing IPv6 for Windows NT - USENIX

2 Windows NT Networking Architecture Network protocols in Windows NT are dynamically loadable device drivers, much like any other device driver in Windows NT [1]. It is possible to add a new protocol to the system by writing two new components: a kernel-level driver (tcpip6sys in Figure 1) that exports the TDI interface and uses the NDIS.
